

Americana Island Built-in guide

If you add Americana Island to your project and it looks like this

The shader graph is missing. To add it to project goto Window>Package Manager>Packages: Unity Registry -> Shader graph and Install it (it's free)
That will fix the purple (missing shader/textures) error. Should look like this

Lighting Errors

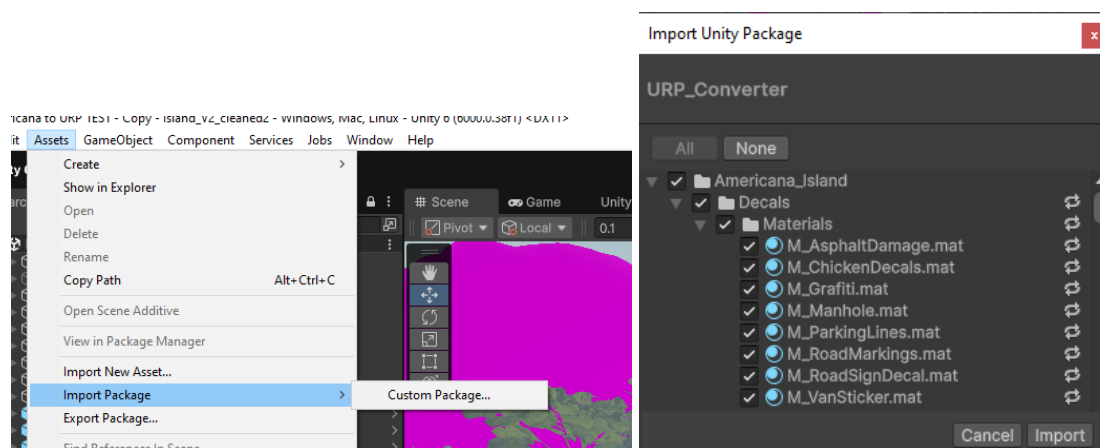

If the scene lighting looks washed out for example like here(left picture),

the post process volume might be missing, if thats the case just add it from Window>Package Manager>Packages: Unity Registry -> Post Processing. It usually is already set up in the project under PostVolume. Make sure Post-process Volume is enabled and set up as well as Post-process Layer is added to camera and set Layer as Post

Converting built-in to URP

We have added a 1 click solution to convert to URP, to use it simply import URP_Converter.unitypackage in to your project. Import it using Assets->Import Package->Custom package or by dropping the package file into project. Make sure All is checked and press Import button.

After that import URP_Update.unitypackage using same process as before for URP_Converter.unitypackage

Note. Make sure in the scene under World prefab PostVolume Layer is set to Default and make sure Volume profile inside PostVolume is set to "PostVolume Profile URP" otherwise colors might look a washed out
